

# Climate protection superiority house GEMINI next Generation

For decades we have heard "Saving Restricting Renunciations" sermons for climate protection. This is a thoroughly failed experiment. Real climate protection can and will only work by raising living standards.

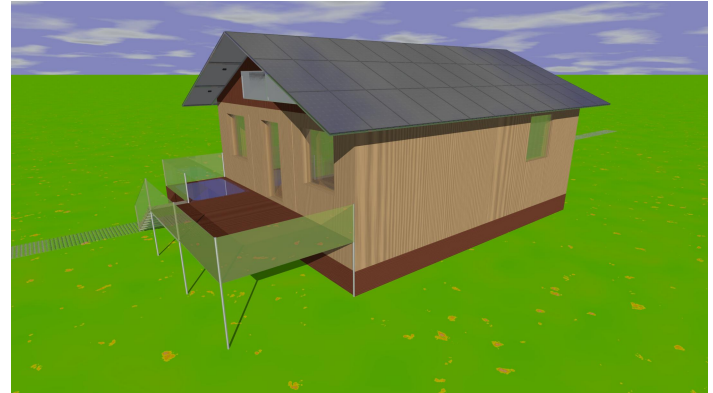

Every detail of the GEMINI next Generation is designed according to this philosophy: Is it cheaper, can more comfort and safety be created?

The standard version has 22 kW of photovoltaic on only 64 m<sup>2</sup> of living space. Another 6 kW should be on the carport or garage.

40 kWh lithium iron phosphate batteries make it possible to charge the car at night and to feed electricity into the grid as needed. Expandable up to 160 kWh.

33 m<sup>3</sup> rainwater storage tanks make it possible not to let your garden dry out in a long drought period, but is at the same time a central element of the heating system.

600 kWh of heat that can be stored enables heat to be produced in an optimised manner.

Snow shoveling no Thank you! Footpaths and access roads can be kept snow-free with underfloor heating. Heated garage possible, this saves electricity with electric cars.

Without cellar it offers a multiple of storage space of usual cellar compartments in blocks of flats.

The value of your own electricity production included for less than 250 EUR per month (DIY-customers without costs for the property) payable. Affordable for the richest 90 % of the population.
